# Contents

# Preface

These are notes for a reading course under Professor Dave Anderson. They begin with a review of some material from Fulton's *Young Tableaux*[1] [Ful97]. However, the primary focus is Manivel's *Symmetric Functions, Schubert Polynomials, and Degeneracy Loci* [Man01] which one could see as a quasi-sequel.

[1]which throughout these notes will be spelled as "tableaux" or "tableau" with no real consistency.

# Chapter 1

# [Ful97] Geometry

**Solution: [Ful97] §9.1 Ex. 1:** Choose a basis $\{e_1, \ldots, e_m\}$ so that $E$ can be identified with $\mathbb{C}^m$. Let $i_1 < \cdots < i_{d-1}$ and $j_1 < \cdots j_{d+1}$ be sequences in $[m]$. Apply §9.1 Equation (1) with $k = 1$ to the sequences $j_2 < \cdots < j_{d+1}$ and $i_1 < \cdots < i_{d-1}, j_1$ by fixing $j_1$ to be the vector swapped successively with the $j_2 < \cdots < j_{d+1}$. Reordering the indices and applying the appropriate sign change yields the desired alternating summation. $\square$

**Solution: [Ful97] §9.1 Ex. 2:** We have that $V \subseteq E = \mathbb{C}^4$ is given as the kernel of multiplication of a matrix $A = (a_{i,j})_{\substack{1\le i\le 4\\ 1\le j\le 2}}$. To find this matrix, the given conditions of the $x_{i,j}$ describe the following determinantal conditions on the entries of $A$:

$$\begin{aligned}
x_{1,2} = 1 &\iff \Delta_{1,2}(A) = 1,\\
x_{1,3} = 2 &\iff \Delta_{1,3}(A) = 2,\\
x_{1,4} = 1 &\iff \Delta_{1,4}(A) = 1,\\
x_{2,3} = 1 &\iff \Delta_{2,3}(A) = 1,\\
x_{2,4} = 2 &\iff \Delta_{2,4}(A) = 2,\\
x_{3,4} = 3 &\iff \Delta_{3,4}(A) = 3,
\end{aligned}$$

where $\Delta(j_1, j_2)(A)$ is the $2 \times 2$ minor of $A$ defined by picking columns $j_1, j_2$. From here, we must make an assumption based on which affine portion of $\mathbb{P}^6$ our matrix lives in. This amounts to picking some $i_1, i_2$ so that the minor given by those columns is the identity matrix. For the given conditions, we could pick $(i_1, i_2) = (1, 2)$, $(1, 4)$, or $(2, 3)$. We give $A$ for each of these conditions respectively:

$$A = \begin{pmatrix} 1 & 0 & -1 & -2 \\ 0 & 1 & 2 & 1 \end{pmatrix}, A = \begin{pmatrix} 1 & 2 & 3 & 0 \\ 0 & 1 & 2 & 1 \end{pmatrix}, A = \begin{pmatrix} 2 & 1 & 0 & -3 \\ -1 & 0 & 1 & 2 \end{pmatrix}.$$

□
