Preface

At the time of writing this, I am starting my PhD at The Ohio State University. Currently a large part of my interests in algebra are about algorithms as they relate to polynomials and algebraic geometry. I've been doing a bunch of problems from *Ideals, Varieties, and Algorithms* [CLO15]. However, it seems that *Using Algebraic Geometry* [CLO05] Ex. moves through the material faster as it assumes you know more algebra. So I've moved onto working through this book as well as trying to comprehend Sturmfel's *Algorithms in Invariant Theory* [Str08].

Chapter 1

Introduction

1.1 Polynomials and Ideals

Solution: [CLO05] Ex. 1.1.1:

- (a) We have that $x(x y^2) + y(xy) = x^2 xy^2 + xy^2 = x^2$.
- (b) It suffices to check for generators. We have that $x + (-1)(y^2) = x y^2$, y(x) = xy, and $y^2 = y^2$ showing that $\langle x y^2, xy, y^2 \rangle \subseteq \langle x, y^2 \rangle$. Then $x y^2 + y^2 = x$ and $y^2 = y^2$ shows the reverse containment and overall the ideals are equal.
- (c) We already know from 1. that x^2 lives in $\langle x-y^2, xy \rangle$. Since xy=xy, we overall have that $\langle x^2, xy \rangle \subseteq \langle x-y^2, xy \rangle$. It remains to check if $x-y^2 \in \langle x^2, xy \rangle$. However, notice that every element of $\langle x^2, xy \rangle$ is divisible by x while $x-y^2$ is clearly not divisible by x. Thus $x-y^2 \notin \langle x^2, xy \rangle$ and the two ideals are not equal.

Solution: [CLO05] Ex. 1.1.2: Let $f,g \in \langle f_1,\ldots,f_s \rangle$. Then $\exists p_1,\ldots,p_s,q_1,\ldots,q_s$ such that $f=\sum_{i=1}^s p_i \cdot f_i$ and $g=\sum_{i=1}^s q_i \cdot f_i$. Thus $f+g=\sum_{i=1}^s (p_i+q_i) \cdot f_i$ which shows that $f+g \in \langle f_1,\ldots,f_s \rangle$. Then let $p \in k[x_1,\ldots,x_n]$. We have that $p \cdot f=p\sum_{i=1}^s p_i f_i=\sum_{i=1}^s (p \cdot p_i) \cdot f_i$ which shows that $\langle f_1,\ldots,f_s \rangle$ is an ideal. \Box

Solution: [CLO05] Ex. 1.1.3: We already know that $\langle f_1, \ldots, f_s \rangle$ is an ideal by [CLO05] Ex. 1.1.2. Now suppose that J is an ideal containing $\{f_1, \ldots, f_s\}$. Then, since ideals are closed under addition and scaling, we have that for all $p_1, \ldots, p_s \in k[x_1, \ldots, x_n]$ that $\sum_{i=1}^s p_i \cdot f_i \in J$. Thus, $\langle f_1, \ldots, f_s \rangle \subseteq J$.

Solution: [CLO05] Ex. 1.1.4: We claim that $\langle f_1, \ldots, f_s \rangle = \langle g_1, \ldots, g_t \rangle$ if and only if $\{g_1, \ldots, g_t\} \subseteq I$ and $\{f_1, \ldots, f_s\} \subseteq J$. The forward implication is immediate. Then by [CLO05] Ex. 1.1.3, if $\{g_1, \ldots, g_t\} \subseteq I$ then $J \subseteq I$. Similarly, $\{f_1, \ldots, f_s\} \subseteq J \implies I \subseteq J$ and overall I = J. This fact was used in [CLO05] Ex. 1.1.1 (b). \square

Solution: [CLO05] Ex. 1.1.5: It suffices to show that $z - x^3 \in \langle y - x^2, z - xy \rangle$ and and $z - xy \in \langle x - y^2, z - x^3 \rangle$. Indeed we have that $(z - xy) + x(y - x^2) = z - x^3$ which also yields that $z - xy = z - x^3 - x(y - x^2)$.

Solution: [CLO05] Ex. 1.1.6: If $I = \{0\}$ then $I = \langle 0 \rangle$. So suppose $I \neq 0$. Let $d \in I$ be of minimal degree. $\langle \langle d = \gcd(I) \text{ but I need infinite Bezout.} \rangle$ Then we claim that $\langle d \rangle = I$. Since $d \in I$, we have that $\langle d \rangle \subseteq I$. Now let $f \in I$. By Euclidean division, there exists $q, r \in k[x]$ such that f = qd + r where either r = 0 or $0 \le \deg(r) \le \deg(d) - 1$. If r = 0 then $f \in \langle d \rangle$ and we are done. So suppose $r \ne 0$. Then $f, qd \in I \implies r = f - qd \in I$. Thus, $r \in I$ is of degree strictly less than d, contradicting the minimality of the degree of d. So we must have that r = 0 and overall $\langle d \rangle = I$.

Solution: [CLO05] Ex. 1.1.7:

- (a) Suppose $f(x) \in \langle x \rangle$. Then $f(x)^m \in \langle x^n \rangle$ so $f(x) \in \sqrt{\langle x^n \rangle}$ Now suppose that $f(x) \in \sqrt{\langle x^n \rangle}$. Then $\exists k$ such that $f(x)^k \in \langle x^n \rangle$. Thus $f(x)^k$ is a multiple of x^n . This implies that $f(x)^k$ is a multiple of x. Then notice that the unique factorization of $f(x)^k$ into irreducibles is the kth power of the factorization of f(x) into irreducibles. Thus x must be a factor of f(x) and so $f(x) \in \langle x \rangle$. Note, this heavily uses the fact that k[x] is a unique factorization domain for all fields k.
- (b) We claim that $\sqrt{\langle p(x)\rangle} = \langle (x-a_1)\cdots(x-a_m)\rangle = I$. Suppose $f(x) \in I$. Let $k = \max e_1, \dots, e_n$. Then $p(x) \mid f(x)^k$ so $f(x) \in \sqrt{\langle p(x)\rangle}$. Now suppose that $f(x) \in \sqrt{\langle p(x)\rangle}$. Then $\exists k$ such that $f(x)^k \in \langle p(x)\rangle$. Thus $f(x)^k$ is a multiple of each $(x-a_i)$. Then notice that the unique factorization of $f(x)^k$ into irreducibles is the kth power of the factorization of f(x) into irreducibles. Thus f(x) is a multiple of each $(x-a_i)$ and so $f(x) \in I$.
- (c) Radical ideals are the ideals I such that $\sqrt{I} = I$. Notice that $\mathbb{C}[x]$ is a principal ideal domain and so any such I must be generated by a single polynomial. Since every polynomial in $\mathbb{C}[x]$ splits into linear factors, (b) immediately implies that the only radical ideals of $\mathbb{C}[x]$ are the ones which are of the form $\langle (x-a_1)\cdots(x-a_m)\rangle$ for $a_1,\ldots,a_m\in\mathbb{C}[x]$.

Solution: [CLO05] Ex. 1.1.8:

- (a) Let \mathfrak{p} be a prime ideal in $k[\overline{x}]$. Clearly $\mathfrak{p} \subseteq \sqrt{\mathfrak{p}}$ always. Let $f(\overline{x}) \in \sqrt{\mathfrak{p}}$. Then $f(\overline{x})^m \in \mathfrak{p}$ for some $m \in \mathbb{Z}_{\geq 1}$. We prove the reverse inclusion by induction on m. If m = 1 then $f(\overline{x}) = f(\overline{x})^1 \in \mathfrak{p}$. Now let m > 1 and suppose the claim holds for all $k \leq m$. Then suppose $f(\overline{x})^{m+1} \in \mathfrak{p}$. Then $f(\overline{x}) \cdot f(\overline{x})^m \in \mathfrak{p}$ Either $f(\overline{x}) \in \mathfrak{p}$ or $f(\overline{x})^m \in \mathfrak{p}$ which by induction implies that $f(\overline{x}) \in \mathfrak{p}$. Thus, $f(\overline{x})^m \in \mathfrak{p} \implies f(\overline{x}) \in \mathfrak{p}$ for all $m \in \mathbb{Z}_{\geq 1}$ and so $\sqrt{\mathfrak{p}} \subseteq \mathfrak{p}$. Thus, all prime ideals are radical.
- (b) Notice that for all fields k that k[x] is a principal ideal domain. Thus, all the prime ideals are the ones generated by a single irreducible polynomial. Also, in k[x] we have that (0) is a prime ideal as well as k[x] is an integral domain. In $\mathbb{C}[x]$, these are the ideals generated by x-z for some $z \in \mathbb{C}$. In $\mathbb{R}[x]$, the primes are the ideals generated by x-r for some $r \in \mathbb{R}$ or x^2+r for some positive $r \in R$. ((What would be a general condition for $\mathbb{Q}[x]$?))

Solution: [CLO05] Ex. 1.1.9:

- (a) First, observe that $\langle x_1, \ldots, x_n \rangle$ is the ideal consisting exactly of polynomials which have no constant term. Let I be an ideal in $k[x_1, \ldots, x_n]$ such that $\langle x_1, \ldots, x_n \rangle \subseteq I$. Thus there exists $f(x_1, \ldots, x_n) \in I \setminus \langle x_1, \ldots, x_n \rangle$. We have by our observation that f has a nonzero constant term z. Then note that the nonconstant terms of f form a polynomial $g(x_1, \ldots, x_n)$ in $\langle x_1, \ldots, x_n \rangle$. Thus, we have that $z = f(x) g(x) \in I$. Since I contains a nonzero constant term, we must have that $I = k[x_1, \ldots, x_n]$.
- (b) Recall that an ideal I is maximal if and only if R/I is a field. Let $I = \langle x_1 a_1, \dots, x_n a_n \rangle$. Consider the evaluation map $\operatorname{ev}_{\overline{a}} \colon k[x_1, \dots, x_n] \to k$ sending $f(x_1, \dots, x_n) \mapsto f(a_1, \dots, a_n)$. Clearly this map is surjective. Then since for all i we have that $x_i \equiv a_i \pmod{I}$, we have that $f(x_1, \dots, x_n) \equiv f(a_1, \dots, a_n) \pmod{I}$ for all $f(x_1, \dots, x_n) \in k[x_1, \dots, x_n]$. Thus, $\operatorname{ev}_{\overline{a}}(f) = f(a_1, \dots, a_n) = 0$ if and only if $f(x_1, \dots, x_n) \in I$. Thus, $\operatorname{ker}(\operatorname{ev}_{\overline{a}}) = I$ and $k[x_1, \dots, x_n]/I$ is a field, meaning $\langle x_1 a_1, \dots, x_n a_n \rangle$ is maximal.
- (c) Since $\mathbb{R}[x]$ is a principal ideal domain, any ideal I strictly containing $\langle x^2+1 \rangle$ is of the form $\langle g(x) \rangle$ for some $g(x) \mid x^2+1$. However, since x^2+1 is irreducible in $\mathbb{R}[x]$, we have that g(x) is either $z(x^2+1)$ for some nonzero $z \in \mathbb{C}$ or g(x) = z for some nonzero $z \in \mathbb{C}$, meaning $\langle g(x) \rangle = \langle x^2+1 \rangle$ or or $\langle g(x) \rangle = \mathbb{R}[x]$. Thus, $\langle x^2+1 \rangle$ is maximal. However, in $\mathbb{C}[x]$, we have that $x^2+1=(x+i)(x-i)$ and so $\langle x^2+1 \rangle \subsetneq \langle x-i \rangle \subsetneq \mathbb{C}[x]$.

Solution: [CLO05] Ex. 1.1.10:

- (a) Since $x^2 + y^2 (x^2 z^3) = y^2 + z^3$ is an element of *I* which does not depend on x, $y^2 + z^3$ is in I_1 .
- (b) For all $\ell \geq 1$, we have that $0 \in I_{\ell}$. Then, if $f(x_{\ell+1}, \ldots, x_n)$, $g(x_{\ell+1}, \ldots, x_n)$ are two polynomials in I who do not depend on the first ℓ variables, then so is f+g. Finally, let $r(x_{\ell}+1, \ldots, x_n) \in k[x_{\ell+1}, \ldots, x_n]$. Then $r \cdot f \in I_{\ell}$ since $r \cdot f \in I$ and still does not depend on any of the first ℓ variables.

Solution: [CLO05] Ex. 1.1.11:

- (a) ((meh))
- (b) ⟨⟨ **meh** ⟩⟩
- (c) We claim that $I + J = \langle f_1, \dots, f_s, g_1, \dots, g_t \rangle$. Clearly $I, J \subseteq \langle f_1, \dots, f_s, g_1, \dots, g_t \rangle$ and thus so is $I \cup J$. By (b), this shows that $I + J \subseteq \langle f_1, \dots, f_s, g_1, \dots, g_t \rangle$. Then, since $f_i = f_i + 0$ and $g_j = 0 + g_j$ for all i, j, we have the reverse inclusion and thus the two ideals are equal.

Solution: [CLO05] Ex. 1.1.12:

- (a) ((meh))
- (b) Suppose that $h(\overline{x}) \in IJ$. Note that IJ is generated by the products $f(\overline{x}) \cdot g(\overline{x})$ for $f(\overline{x}) \in I$, and $g(\overline{x}) \in J$. Then $h(\overline{x})$ consists of sums of terms of the form $r(\overline{x}) \cdot f(\overline{x}) \cdot g(\overline{x})$ for $r(\overline{x}) \in k[\overline{x}]$, $f(\overline{x}) \in I$, and $g(\overline{x}) \in J$. Thus, each term is in both I and J and overall so is $h(\overline{x})$.

To see an example where $IJ \subsetneq I \cap J$, consider $I = \langle x^2y \rangle$ and $J = \langle xy^2 \rangle$ in k[x, y]. Then $I \cap J = \langle x^2y^2 \rangle$ and $IJ = \langle x^3y^3 \rangle$. Thus $IJ \subsetneq I \cap J$ as $I \cap J$ contains x^2y^2 and IJ does not contain x^2y^2 .

1.2 Gröbner Bases

Solution: $\langle\langle$ [CLO05] Ex. 1.3.11 $\rangle\rangle$:

1.3 Affine Varieties

Solution: $\langle\langle \text{[CLO05] Ex. 1.4.9} \rangle\rangle$:

Chapter 2

Solving Polynomial Equations

2.1 Solving Polynomial Systems by Elimination

Solution: $\langle\langle \text{ [CLO05] Ex. 2.1.1 }\rangle\rangle$:

Solution: $\langle\langle \text{ [CLO05] Ex. 2.1.2 }\rangle\rangle$:

Solution: [CLO05] Ex. 2.1.3: We may freely rewrite the polynomial as $p(z) = z^n - a_{n-1}z^{n-1} - \cdots - a_0$ We have that $0 = \overline{z}^n - a_{n-1}\overline{z}^{n-1} - \cdots - a_0$ and so $\overline{z}^n = a_{n-1}\overline{z}^{n-1} + \cdots + a_0$. Suppose now that $|\overline{z}| \ge 1$. Then

$$|\overline{z}|^n = |a_{n-1}\overline{z}^{n-1} + \dots + a_0| \le |a_{n-1}||z|^{n-1} + \dots + a_0 \le |a_{n-1}|\overline{z}^{n-1} + \dots + a_0|\overline{z}^{n-1}.$$

Thus, $|\overline{z}| \le |a_{n-1}| + \dots + |a_0|$. However, we assumed that $|\overline{z}| \ge 1$. This may not be the case. Thus, $|\overline{z}| \le B := \max\{1, |a_{n-1}| + \dots + |a_0|\}$.

Solution: $\langle\langle$ [CLO05] Ex. 2.1.4 $\rangle\rangle$: Numerically find all roots of $2z^6 + 2z^5 - z^4 - z^3 - 2z^2 - 2z - 2$.

Solution: [CLO05] Ex. 2.1.5: We apply Buchberger's Criterion. Let $f(x,y) = x^2 + 2x + 3 + y^5 - y$ and $g(x,y) = y^6 - y^2 + 2y$. Then we have that

$$S(f,g) = \frac{x^2y^6}{x^2} \cdot (x^2 + 2x + 3 + y^5 - y) - \frac{x^2y^6}{y^6} \cdot (y^6 - y^2 + 2y) = y^6 \cdot (x^2 + 2x + 3 + y^5 - y) - x^2 \cdot (y^6 - y^2 + 2y).$$

This shows that $\overline{S(f,g)}^G = 0$ which yields that *G* is a Gröbner basis.

Solution:
$$\langle \langle \text{ [CLO05] Ex. 2.1.6} \rangle \rangle$$
:

Solution:
$$\langle \langle \text{ [CLO05] Ex. 2.1.7} \rangle \rangle$$
:

Solution: [CLO05] Ex. 2.1.8:

- (a) Let \overline{z} be a simple root of p(z), so p(z) = 0 but $p'(z) \neq 0$. Then $N_p(\overline{z}) = \overline{z} \frac{p(\overline{z})}{p'(\overline{z})} = \overline{z}$ meaning \overline{z} is a fixed point of $N_p(z)$.
- (b) Suppose that \overline{z} is a multiple root of p(z) with multiplicity $m \ge 2$. Then we may express $p(z) = \tilde{p}(z)(z-\overline{z})^m$ such that $\tilde{p}(\overline{z}) \ne 0$. Thus, we have that

$$\begin{split} N_p(z) &\coloneqq z - \frac{p(z)}{p'(z)} \\ &= z - \frac{\tilde{p}(z)(z - \overline{z})^m}{\tilde{p}'(z)(z - \overline{z})^m + m\tilde{p}(z)(z - \overline{z})^{m-1}} = z - \frac{\tilde{p}(z)(z - \overline{z})}{\tilde{p}'(z)(z - \overline{z}) + m\tilde{p}(z)} \end{split}$$

Note that $m\tilde{p}(\bar{z}) \neq 0$. Thus, we have that

$$\left|N_p(\overline{z})\right| = \left|\overline{z} - \frac{\widetilde{p}(\overline{z})(\overline{z} - \overline{z})}{\widetilde{p}'(\overline{z})(\overline{z} - \overline{z}) + m\widetilde{p}(\overline{z})}\right| = |\overline{z}| \leq \operatorname{LC}(p) \cdot B$$

where B is the value from [CLO05] Ex. 2.1.3 and LC(p) is the leading coefficient of p(z).

(c) Suppose now that \overline{z} is a simple root of $p(\overline{z})$. Then we may express $p(z) = \tilde{p}(z)(z - \overline{z})$ such that $\tilde{p}(\overline{z}) \neq 0$. We have that

$$p'(z) = \tilde{p}'(z)(z - \overline{z}) + \tilde{p}(z)$$

and evaluation of p'(z) at \overline{z} is nonzero.

(d) Let \overline{z} be a root of multiplicity m. Following (b), we write $p(z) = \tilde{p}(z)(z-\overline{z})^m$ such that $\tilde{p}(\overline{z}) \neq 0$. Then we have, by differentiating the expression for $N_p(z)$ from (b), that

$$N_{p}'(z) = 1 - \frac{(\tilde{p}'(z)(z-\overline{z}) + \tilde{p}(z))(\tilde{p}'(z)(z-\overline{z}) + m\tilde{p}(z)) - (\tilde{p}(z)(z-\tilde{z}))(\tilde{p}''(z)(z-\overline{z}) + \tilde{p}'(z) + m\tilde{p}'(z))}{(\tilde{p}'(z)(z-\overline{z}) + m\tilde{p}(z))^{2}}$$

Evaluation at $z = \overline{z}$ yields that $\lim_{z \to \overline{z}} N_p'(z) = 1 - \frac{1}{m}$.

(e) Let \overline{z} be a root of multiplicity m. Following (b), we write $p(z) = \tilde{p}(z)(z - \overline{z})^m$ such that $\tilde{p}(\overline{z}) \neq 0$. Then

$$p'(z) = \tilde{p}'(z - \overline{z})^m + m\tilde{p}(z)(z - \overline{z})^{m-1} = (z - \overline{z})^{m-1}(\tilde{p}'(z)(z - \overline{z}) + m\tilde{p}(z)).$$

Notice that $\tilde{p}'(\overline{z})(\overline{z}-\overline{z})+m\tilde{p}(\overline{z})=m\tilde{p}(\overline{z})\neq 0$. Thus, a root of multiplicity $m\geq 1$ of p(z) is a root of multiplicity m-1 of p'(z). This implies that if we have roots $\overline{z}_1,\ldots,\overline{z}_k$ with multiplicities $m_1,\ldots,m_k\geq 1$, then $\gcd(p(z),p'(z))=(z-\overline{z}_1)^{m_1}\cdots(z-\overline{z}_k)^{m_k}$. Thus, the polynomial $p_{\mathrm{red}}(z)=\frac{p(z)}{\gcd(p(z),p'(z))}$ has the same roots of p(z) but all with multiplicity 1 which is the best case for Newton's method.

Solution: [CLO05] Ex. 2.1.9:

(a) Let $p(z) = z^2 + 1$. We have that

$$N_p(z) = z - \frac{z^2 + 1}{2z} = \frac{2z^2 - z^2 + 1}{2z} = \frac{z^2 + 1}{2z} = \frac{z^2 + 1}{2z} = \frac{x^2 + 2ixy - y^2 + 1}{2x + 2iy}.$$

If z is real then y = 0 and so $N_p(x) = \frac{x^2+1}{2x}$ which is always real. Thus, Newton's method will never reach the imaginary roots of $z^2 + 1$. However, if we begin with a guess with nonzero imaginary part, then the guess does converge as expected.

(b) $\langle\langle$ Just basic arithmetic not worth doing. $\rangle\rangle$

Solution: [CLO05] Ex. 2.1.10: Let \overline{z} be a root of p(z). Then $-\overline{z}^n = a_{n-1}\overline{z}^{n-1} + \cdots + a_0$ and so

$$\begin{split} |\overline{z}|^n &= \left|a_{n-1}\overline{z}^{n-1} + \dots + a_0\right| \\ &\leq \max_i \left\{ |a_i| \right\} \cdot \left|\overline{z}^{n-1} + \dots + 1\right| \\ &\leq \max_i \left\{ |a_i| \right\} \cdot \left(|\overline{z}|^{n-1} + \dots + 1 \right) \\ &= \max_i \left\{ |a_i| \right\} \cdot \frac{|\overline{z}|^n + 1}{|\overline{z}| - 1} \leq \max_i \left\{ |a_i| \right\} \cdot \frac{|\overline{z}|^n}{|\overline{z}| - 1}. \end{split}$$

Thus, $|\overline{z}|^n \leq \max_i \{|a_i|\} \cdot \frac{|z|^n}{|z|-1}$ which implies that $|z|-1 \leq \max_i \{|a_i|\}$. Thus, $|z| \leq 1 + \max_i \{|a_i|\}$. \square

2.2 Finite Dimensional Algebras

Solution: $\langle \langle \text{ [CLO05] Ex. 2.2.1} \rangle \rangle$:

Solution: [CLO05] Ex. 2.2.2: It is clear that $\langle p_i(x_i) \rangle \subseteq I \cap k[x_i]$. Now suppose that $f(x_i) \in I \cap k[x_i]$. Then $\deg(f(x_i))$ must be $\geq m_i$. If not, then by the minimality of m_i we would arrive at a contradiction. Now by the division algorithm, write $f(x_i) = q(x_i)p_i(x_i) + r(x_i)$ where $\deg(r_{x_i}) < m_i$. Then $r(x_i) = f(x_i) - q(x_i)p(x_i) \in I$ and so $r(x_i)$ must be 0 since if not, we would arrive at a contradiction of the minimality of m_i .

This gives us an algorithm to compute $p_i(x_i)$. Let I be a zero dimensional ideal and G a Gröbner basis for I. Then we know there exists m_i such that $\{1, [x_i], \ldots, [x^{m_i}]\}$ is linearly dependent in $k[\overline{x}]/I$. In fact, we may use the Finiteness Theorem to set m_i to the smallest integer such that $x_i^{m_i} = \operatorname{LT}(g)$ for some $g \in G$. Since $k[x_1, \ldots, x_n]/I$ is a vector space, we can check linear independence in the usual way. See code/ch2/2_2_2.sage for a SageMath implementation of this.

Solution: [CLO05] Ex. 2.2.3: Let $0 \neq f(x) \in \sqrt{\langle p(x) \rangle}$. Then there exists $m \geq 1$ such that $f^m \in \langle p(x) \rangle$ and so $p(x) \mid f(x)^m$. In particular, each linear factor $(x - \overline{z})$ of p(x) divides $f(x)^n$ and so divides f(x) as $(x - \overline{z})$ is irreducible. Thus, $p_{\text{red}}(x) \mid f(x)$ and so $f(x) \in \langle p_{\text{red}}(x) \rangle$. Conversely, suppose $f(x) \in \langle p_{\text{red}}(x) \rangle$ so that $\langle p_{\text{red}} \rangle \mid f(x)$. Label the roots of p(x) as $\overline{z}_1, \dots, \overline{z}_r$, each $\overline{z}_i \in \overline{k}$. Then for each $i, (x - \overline{z}_i) \mid f(x)$ Let m_i be the multiplicity of z_i in p(x) and $m = \max\{m_1, \dots, m_r\}$. Then $p(x) \mid f(x)^m$ and so $f(x) \in \sqrt{\langle p(x) \rangle}$

Solution: [CLO05] Ex. 2.2.4: We use the algorithm from [CLO05] Ex. 2.2.2 implemented in code/ch2/2_2_2sage. See code/ch2/2_2_sage for the code in action.

Solution: $(\langle \text{[CLO05] Ex. 2.2.5} \rangle)$: Then $\sqrt{I} = I + \langle x(x-1), y(y-2) \rangle$. Since $I \subseteq \sqrt{I}$, we see that $\dim \mathbb{C}[x,y]/I \ge \dim \mathbb{C}[x,y]/\sqrt{I}$. A quick SageMath computation confirms this: $\dim \mathbb{C}[x,y]/I = 9$ and $\dim \mathbb{C}[x,y]/\sqrt{I} = 2$. See code/ch2/2_2_5.sage for the code in action. Then, since $I \subseteq \sqrt{I}$ we have that $V(\sqrt{I}) \subseteq V(I)$. Notice that

$$y^{4}x + 3x^{3} - y^{4} - 3x^{2} = y^{4}(x - 1) + 3x^{2}(x - 1) = (y^{4} + 3x^{2})(x - 1)$$
$$x^{2}y - 2x^{2} = x^{2}(y - 2)$$
$$2y^{4}x - x^{3} - 2y^{4} + x^{2} = 2y^{4}(x - 1) - x^{2}(x - 1) = (2y^{4} - x^{2})(x - 1).$$

Thus, (1,2) and (0,0) are the only two points in V(I). Since it is evident that $V(\sqrt{I})$ contains these two points, we see in this case that $V(\sqrt{I}) = V(I)$.

Solution: [CLO05] Ex. 2.2.6: A grevlex Gröbner basis for I is $\{y^4 - 16y^2, x^3 - x^2, -2x^2\}$. Thus, by the Finiteness Theorem, we know that the for monomials $x^a y^b$ in $\mathbb{C}[x,y]/I$ we must have that $0 \le a \le 1$ and $0 \le b \le 3$. See code/ch2/2_2_6. sage for the code in action to compute the table.

Solution: [CLO05] Ex. 2.2.7: We implement the algorithm described in $\langle\langle$ [CLO05] Ex. 1.3.11 $\rangle\rangle$. See \langle code/ch2/2_2_7. sage for the code in action.

Solution: [CLO05] Ex. 2.2.8:

- (a) See code/ch2/2_2_8. sage for the code in action.
- (b) Since each of the I_j are maximal ideals and $I_j \subseteq \sqrt{I_j}$, we must have that $I = \sqrt{I_j}$. Thus $I(V(I_j)) = I_j$ and we must have that $I_j = \sqrt{I_j}$. Since each I_j is radical and $I = \bigcap_{j=1}^5 I_j$, we have by [CLO05] Ex. 2.2.7 that I is radical.

Solution: [CLO05] Ex. 2.2.9:

- (a) Let $f(\overline{x}) \in I + \langle p \rangle$ and let $1 \le j \le d$. Then $f(\overline{x}) = g(\overline{x}) + h(\overline{x})p(x_1)$ for some $g(\overline{x}) \in I$ and $h(\overline{x}) \in k[\overline{x}]$. We have that $(x_1 a_j) \mid p(x_1)$ and so $h(\overline{x})p(x_1) \in \langle x_1 a_j \rangle$. Thus, $f(\overline{x}) = g(\overline{x}) + h(\overline{x})p(x_1) \in I + \langle x_1 a_j \rangle$. As j was arbitrary, we have that $f(\overline{x}) \in \bigcap_j (I + \langle x_1 a_j \rangle)$.
- (b) Let $f(\overline{x}) \in p_j \cdot (I + \langle x_1 a_j \rangle)$. Then $f(\overline{x}) = p_j(x_1) \cdot (g(\overline{x}) + h(\overline{x})(x_1 a_j))$ for some $g(\overline{x}) \in I$ and $h(\overline{x}) \in k[\overline{x}]$. We have that $p_j(x_1)g(\overline{x}) \in I$ and $p_j(x_1)h(\overline{x})(x_1 a_j) = h(\overline{x})p(x_1) \in \langle p \rangle$. Thus, $f(\overline{(x)}) = p_j(x_1)g(\overline{x}) + h(\overline{x})p(x_1) \in I + \langle p \rangle$.
- (c) Let $d=\gcd(p_1,\ldots,p_d)$. Then as $d\mid p_1$ and $d\mid p_2$, we have that $d\mid \prod_{j\neq 1,2}(x_1-a_j)$. Continuing on inductively, we have that for all $c\leq d$ that $d\mid \prod_{j\notin [c]}(x_1-a_j)$. In particular, this means that $d\mid \prod_{j\notin [d]}(x_1-a_j)=1$. Thus, d itself is a unit in $k[\overline{x}]$ and p_i and p_j are coprime. By Bezout's Lemma, there exists polynomials $h_1,\ldots,h_d\in k[\overline{x}]$ such that $1=\sum_{j=1}^d h_j(\overline{x})p_j(x_1)$.
- (d) Now let $h(\overline{x}) \in \bigcap_{j=1}^d (I + \langle x_1 a_j \rangle)$. As all the p_j are coprime, we have that there exist polynomials $h_1, \ldots, h_d \in k[\overline{x}]$ such that $1 = \sum_{j=1}^d h_j(\overline{x}) p_j(x_1)$. Thus, $h = \sum_{j=1}^d h_j(\overline{x}) p_j(x_1) h(\overline{x})$. Then for all $1 \le j \le d$, we have that as $p_j(x_1)h(\overline{x}) \in p_j \cdot (I + \langle x_1 a_j \rangle) \subseteq I + \langle p \rangle$. Thus, each summand of $\sum_{j=1}^d h_j(\overline{x}) p_j(x_1) h(\overline{x})$ is in $I + \langle p \rangle$ and so overall $h \in I + \langle p \rangle$.

Solution: [CLO05] Ex. 2.2.10:

- (a) Let $\overline{f}^G = \sum_{j=1}^d c_j(f) x^{\alpha(j)}$ and $\overline{g}^G = \sum_{j=1}^d c_j(g) x^{\alpha(j)}$. Then by combining like terms, we have that $\overline{f}^G + \overline{g}^G = \sum_{j=1}^d (c_j(f) + c_j(g)) x^{\alpha(j)}$. On the other hand, we have that $\overline{f+g}^G = \sum_{j=1}^d c_j(f+g) x^{\alpha(j)}$. Since $\overline{f}^G + \overline{g}^G = \overline{f+g}^G$ and each of the $x^{\alpha(j)}$ are linearly independent, we may equate coefficients and conclude that $c_j(f) + c_j(g) = c_j(f+g)$. For $\lambda \in k$, $\overline{\lambda f}^G = \sum_{j=1}^d c_j(\lambda f) x^{\alpha(j)}$. Now notice that $\overline{\lambda f}^G = \lambda \overline{f}^G$ as we are working over a field. Thus, we have by equating coefficients that $c_j(\lambda f) = \lambda c_j(f)$. Thus, c_j is a linear function $A \to k$.
- (b) Let $\alpha_j \in A^*$ be the linear map $\alpha_j(f) = c_j(f)$. Notice that for all $1 \le i, j \le d$ we have that $\alpha_j(x^{\alpha(i)}) = c_j(x^{\alpha(i)}) = \delta_{i,j}$. Suppose there exists $\lambda_1, \ldots, \lambda_d \in k$ such that $\lambda_1 \alpha_1 + \cdots + \lambda_d \alpha_d = 0$. Then for all $1 \le i \le d$ we have that

$$0 = \left(\sum_{j=1}^{d} \lambda_j \alpha_j\right) (x^{\alpha(i)}) = \sum_{j=1}^{d} \lambda_j \alpha_j (x^{\alpha(i)}) = \lambda_i$$

and so for all $1 \le i \le d$, $\lambda_i = 0$ meaning that $\{\alpha_1, \dots, \alpha_d\}$ is linearly independent. Since we know that $d = \dim A = \dim A^*$, we have that $\{\alpha_1, \dots, \alpha_d\}$ is a basis for A^* .

(c) This was proven in (b).
